

# Automotive Ethernet Training

Colt Correa  
Author – Automotive Ethernet - The Definitive Guide

**INTREPID**  
CONTROL SYSTEMS  
[www.intrepidcs.com](http://www.intrepidcs.com)

# INTREPID CONTROL SYSTEMS, INC.

- Supplier of Automotive Network and Data Logging systems for 25+ years
- Product focused company
- Private company and virtually debt free

- Global support network to react to customer needs quickly
- Investing in new technology
- Automotive Ethernet, CAN FD, Cybersecurity

**INTREPID**  
CONTROL SYSTEMS  
[www.intrepidcs.com](http://www.intrepidcs.com)

# CAN CANnot Any Longer

- Rising demands for bandwidth, QoS, and determinism:
  - Decentralization of functions
  - Integration of consumer products and services
  - Streaming media
  - V2X / Autonomous vehicles
- CAN's evolution to CAN FD addresses bandwidth, but not growing gaps in other areas

# Why Ethernet?

- For one.....Bandwidth!
- Long history of adapting to meet evolving applications and requirements
- Successful efforts to adapt to automotive environment
- Reuse, Reuse, Reuse!!!

*Will there be one network to rule them all?*

# Comparing Ethernet to CAN and FlexRay

# CAN

- Multidrop topology with the ability to add and remove nodes without major effects on other nodes
- Up to 1Mb/s for standard CAN.
- Single twisted pair copper wire
- Easy environment for tool manufacturers: plug and play
- Message or packet-based communication
- Arbitration based method to handle collisions

# FlexRay

- Multidrop topology but all nodes must be pre-programmed with a fixed configuration
- Up to 10Mb/s on each twisted pair
- Single twisted pair copper wire
- Easy environment for tool manufacturers: plug and play
- Message or packet-based communication
- Collision avoidance based on time slots for each node

# Automotive Ethernet

## (100BASE-T1 / 1000BASE-T1)

- Pros

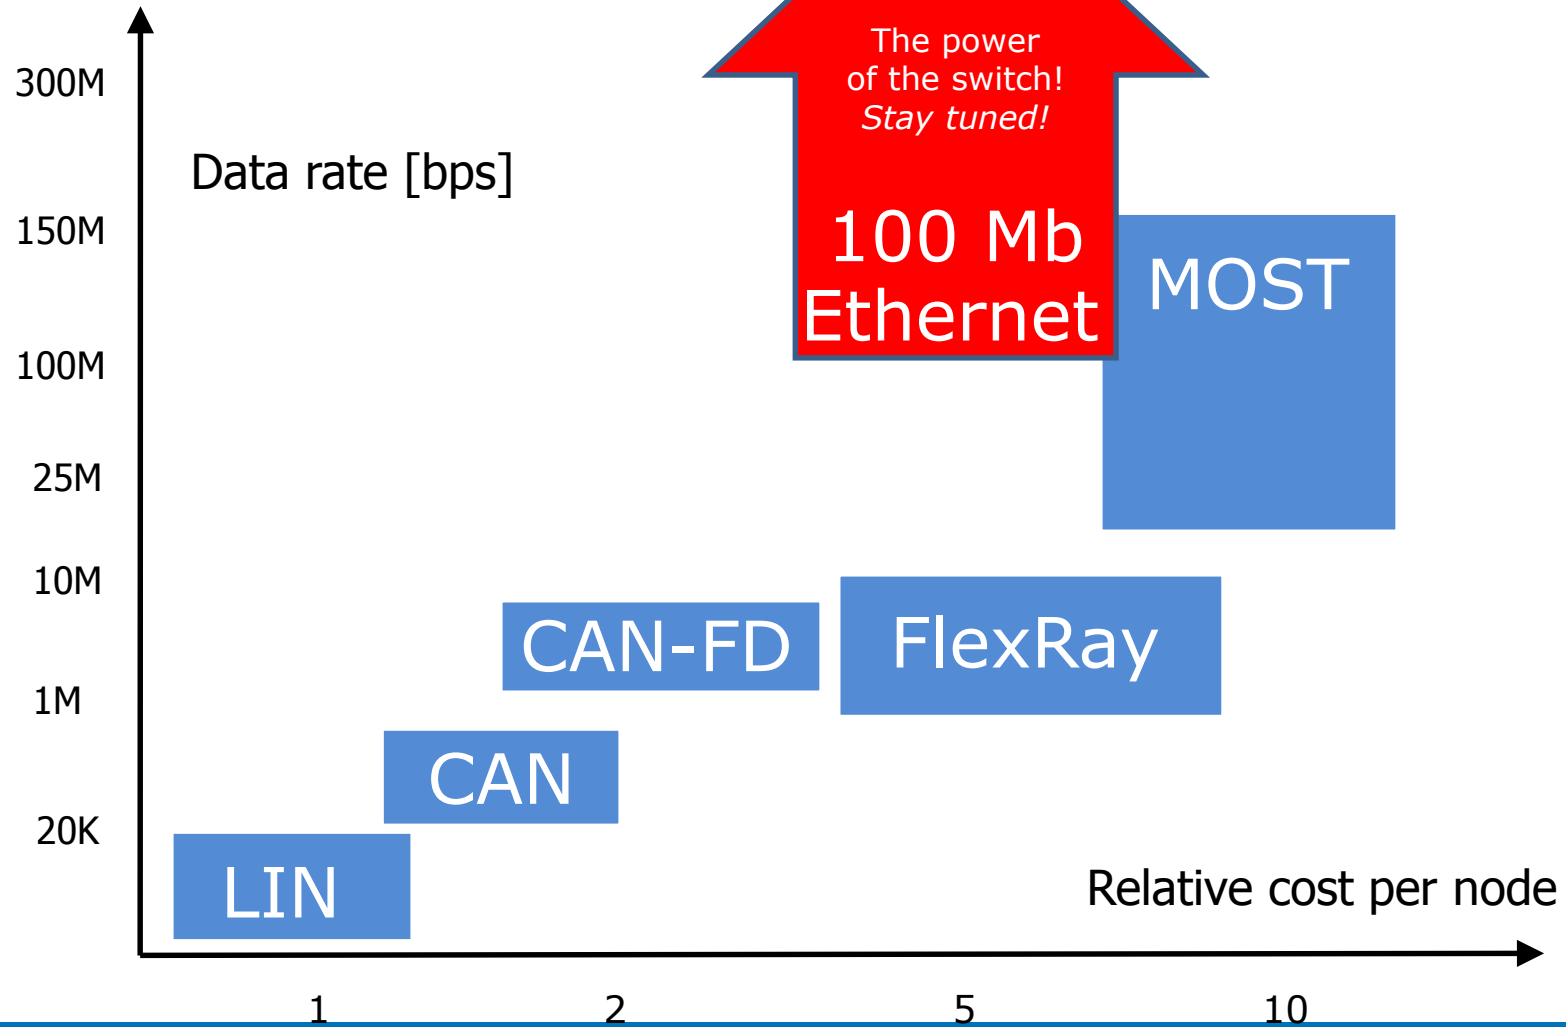

- Up to 1000 Mb/s  
(each direction and each leg)
- Widely used technology  
(much support)
- Good clock synchronization  
technology available (based on  
IEEE 1588)
- History of adaptation to solve new  
problems.

- Cons

- Requires a switch
- Not possible to add or remove  
nodes unless the switch has  
spare ports
- Tools cannot just connect and  
sniff the bus

# Cost vs. Data Rate

10

**INTREPID**  
CONTROL SYSTEMS  
[www.intrepidcs.com](http://www.intrepidcs.com)

# Networking Topologies

- Define how devices are connected together
- Determine network characteristics
- Simple topologies:
  - Point-to-point (or port)
  - Bus (chained or attached) - like CAN and LIN
  - Ring
  - Star
- Complex topologies combine these

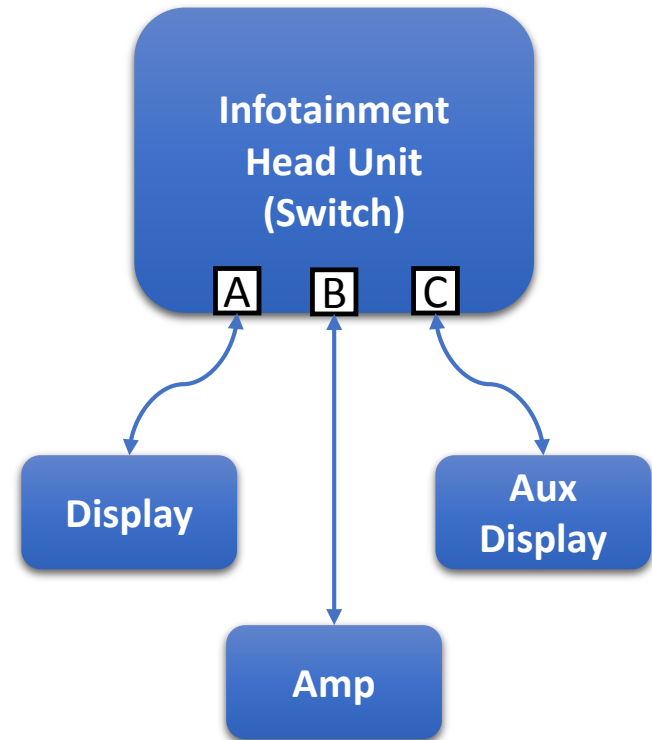

# Hierarchical Star Topology

- Also “tree topology” or “star of stars”
- Multiple levels can be created

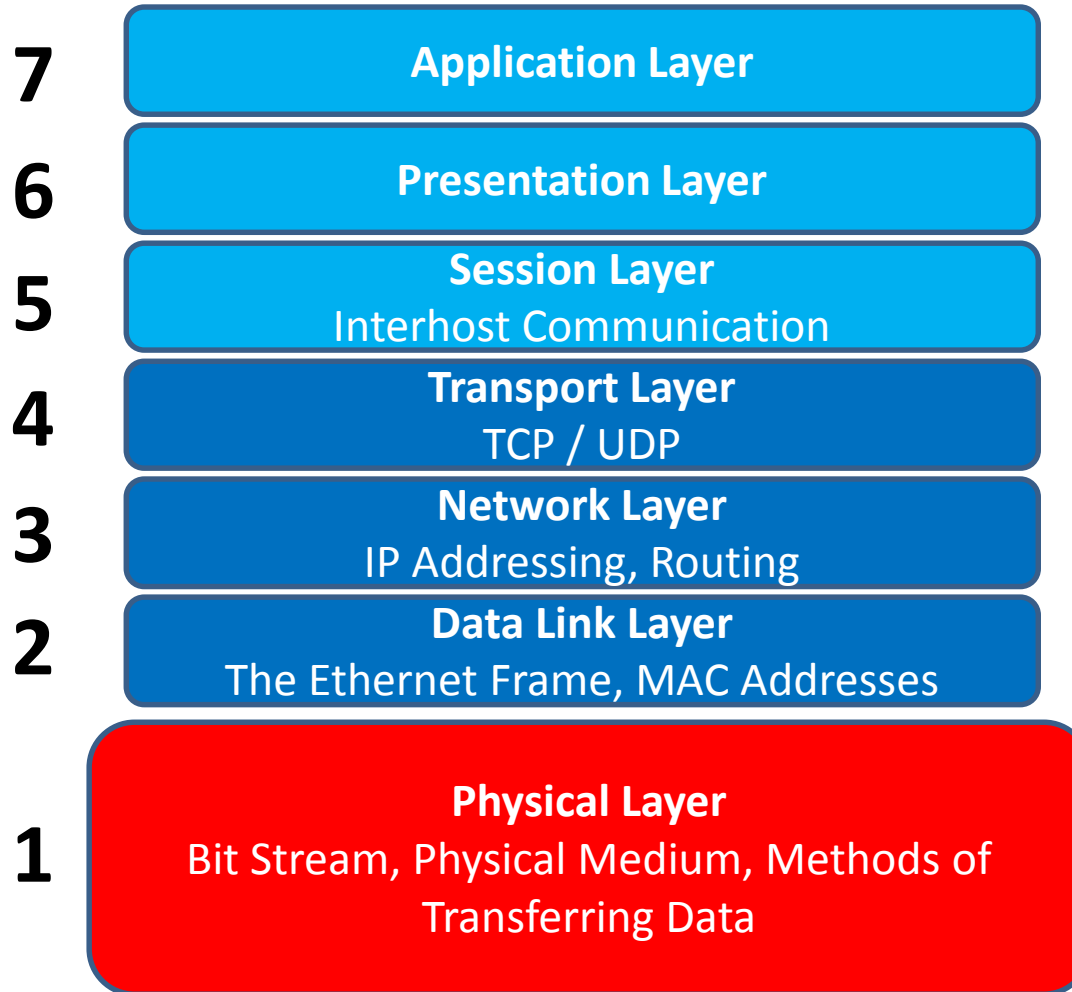

# Today's Ethernet Network

- Original Ethernet (Like CAN)
  - Bus architecture
  - Multiple Nodes / Single Medium
  - Collisions + Arbitration = Inefficient
- Most modern networks are a switched network
  - Devices connected through switches
  - Optimized traffic flow
  - Buffering eliminates collisions
- Each leg (A,B,C) acts as its own network.
- Impossible for Ethernet frames to “collide” using modern full-duplex communication.

# Physical Layer

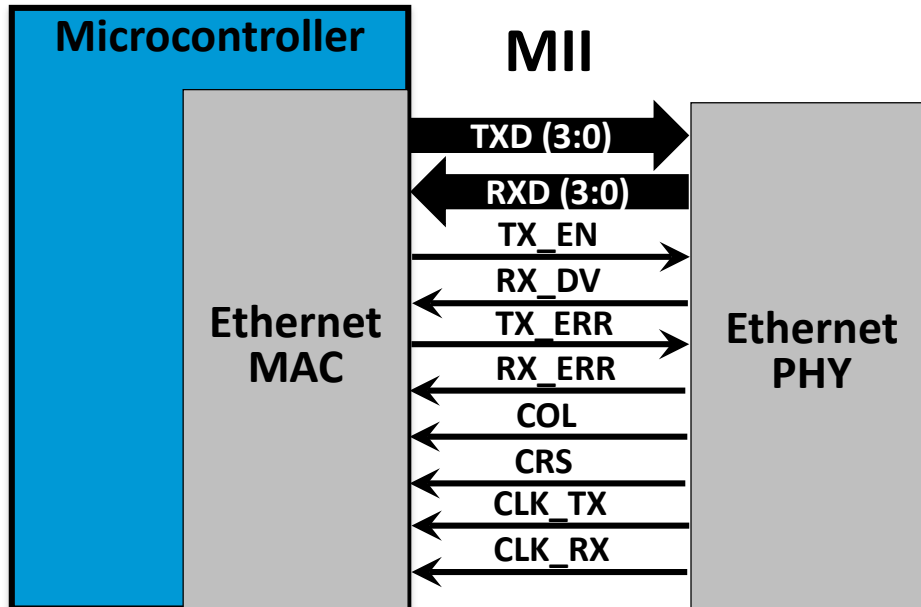

# The Power of MII

- Ethernet Node

- Microcontroller
- Ethernet MAC controller
- Ethernet physical layer (PHY).

- MII

- Media Independent Interface
- Industry standard digital interface
- enables different PHYs to be used with any MAC.
- Evolved into a few variations
  - RMII: Reduced
  - GMII: Gigabit
  - RGMII: Reduced Gigabit
  - SGMII: Serial Gigabit

*Swap out any Ethernet physical layer and reuse everything above*

# Consumer Ethernet Media

- Coax: 10BASE2 (old days)
  - One conductor
  - Half-duplex
- 10/100 Ethernet 100 Mb/s
  - 2 twisted pairs
  - 4 wires
  - Full-duplex
- Gigabit Ethernet
  - 4 twisted pairs
  - 8 wires
  - Full-duplex

Coaxial Cable Construction

10BASE-2

10/100BASE-TX

1000BASE-T

# 1000BASE-T Physical Layer

- PAM-5 (5 logical “states”)
- 2 bits encoded in 5 levels
- 500 mV max span signal
- 100 ms span = 1 logic level

- 4 Twisted Pair
- 250 Mbits/s per twisted pair
- 62.5 MHz frequency
- 125 Mbaud (each direction)
- Uses PAM5 + FEC

*Taken from the IEEE tutorial on 802*

# Automotive Physical Layer

## 100/1000 Mbps

- IEEE 802.3bw: 100BASE-T1
  - 66.6 Mbaud
  - 33.3 MHz Clock
  - Max length 25 meters
  - 2 symbols provide 3 bits of info:  $66.6\text{M} \times 3/2 = 100\text{ Mb/s}$
- IEEE Std 802.3bp: 1000BASE-T1
  - 750 Mbaud
  - 125 MHz Clock
  - Max length 15 meters

### PAM-3

# 10BASE-T1S

## Differentiating Features

- **Goals**

- Full bandwidth utilization
- Reduce latency
- Quality of Service (QoS)

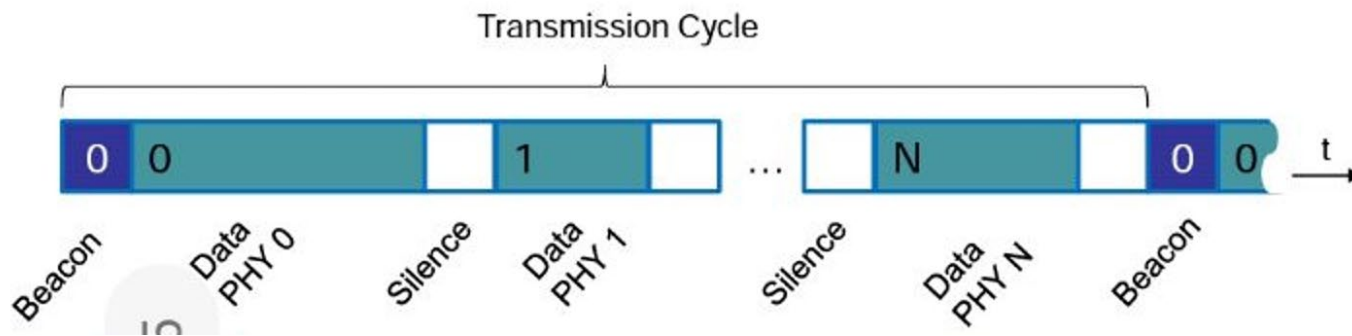

- **Principle**

- Avoid physical collisions on the medium by organizing the media access
  - Called Physical Layer Collision Avoidance (PLCA)

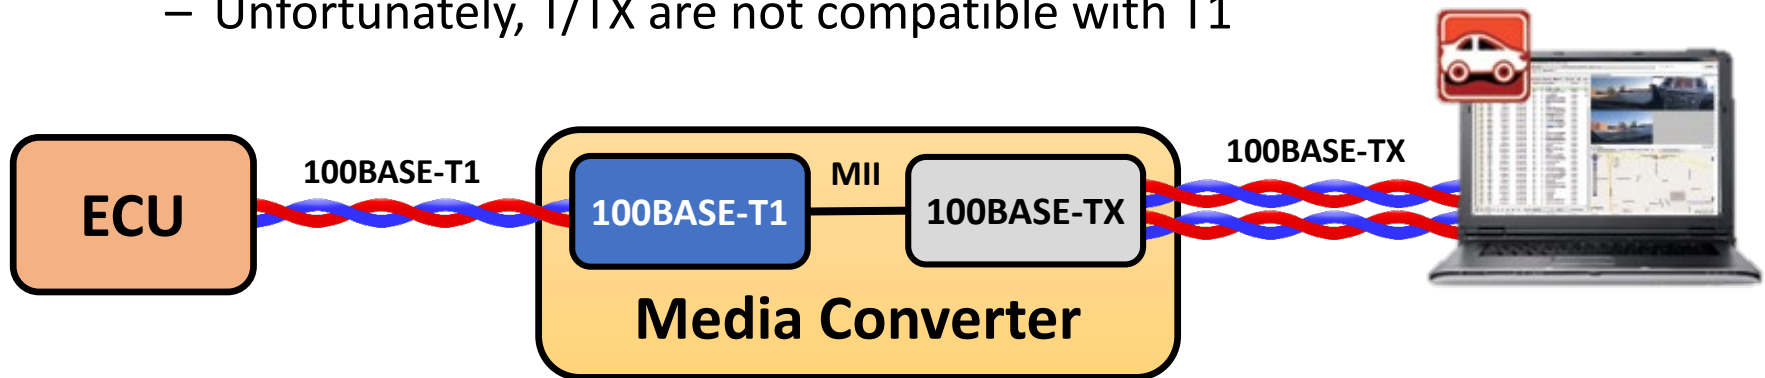

- **How it is done**

- Only the PHY that owns a transmit opportunity is allowed to send data
- Transmit opportunities are given in a round robin manner
- A new cycle of transmit opportunities is started when the master node sends a BEACON
- Works on top of Carrier Sense Multiple Access/Collision Detection (CSMA/CD)

# Mixing Physical Medium

- Plugging together 100BASE-T and 100BASE-TX works
  - “T” implies 8-wire and backward compatible with 4-wire media (TX)
  - Auto negotiation resolves speed
- Does not work for all media
  - Cannot plug an optical fiber to an electrical connector
  - Unfortunately, T/TX are not compatible with T1

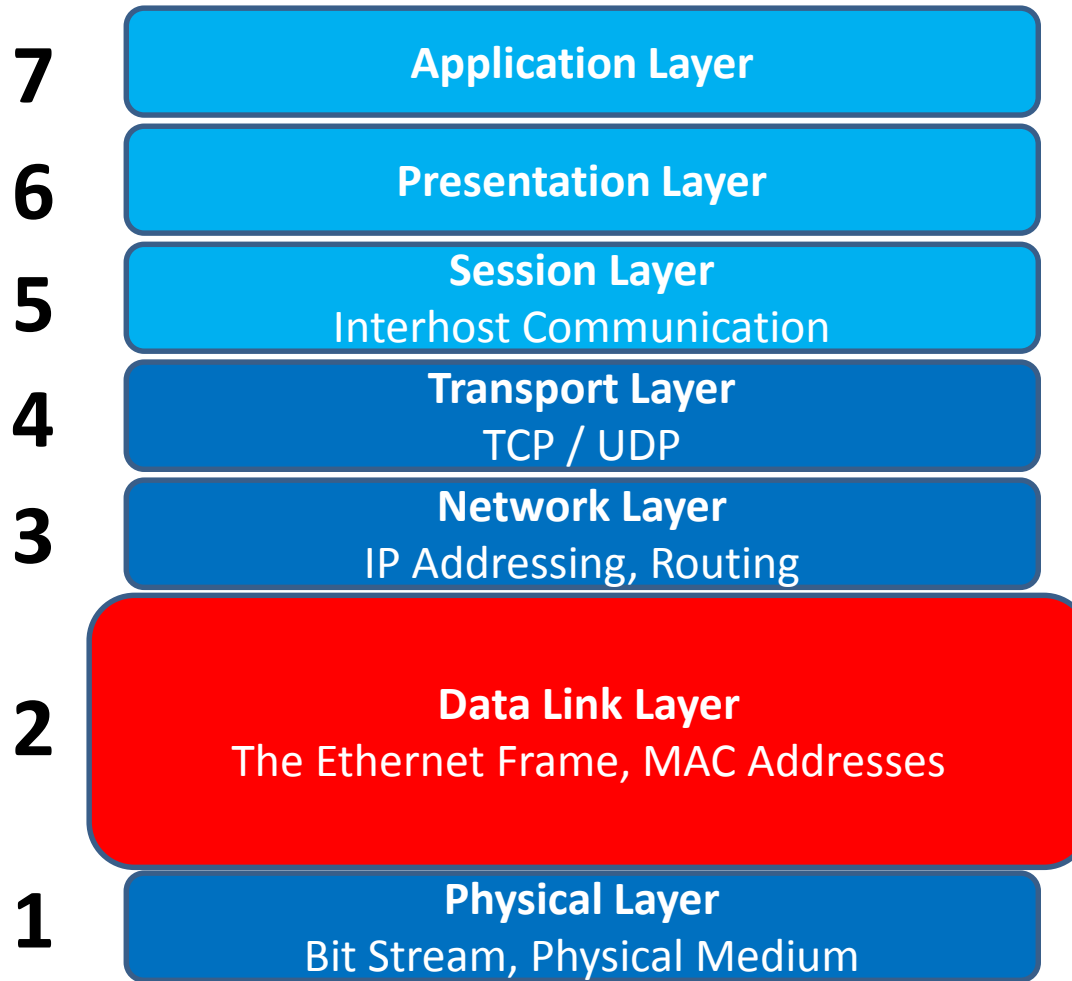

***A Media Converter connects 2 dissimilar media***

# Media Converters

- Convert between different Physical Layer implementations of same network
- Commonly used in AE to connect 100/1000BASE-T1 to conventional Ethernet
- Intrepid's RAD-Moon:
  - 100BASE-T1 to 100BASE-TX
  - 4-wire to 2-wire
  - Essentially two different PHYs connected back-to-back
- RAD-MoonDuo:
  - 2x RAD-Moons in same form factor
  - PHY register access
  - 100BASE-T1/USB Bridge
- RAD-Moon2/SuperMoon:
  - 1000BASE-T1 to 1000BASE-T
  - 8-wire to 2-wire
  - Combine RAD-SuperMoon with RAD-Moon2 to implement an active tap (more on that later)

# Data Link Layer

# The Ethernet Frame

- Lowest level structure to carry all data the data on Ethernet to meet the needs of Layer 2.
  - Device addressing
  - Message formatting,
  - Error detection
  - QoS
- Frames can carry 46 to 1,500 bytes of data
- 12,336 bits at 100 Mb/s takes 123.4  $\mu$ s  
(compare to a 1 Mb/s 8-byte data frame)
- Gigabit = 12.34  $\mu$ S Max Frame Transmission Time

| 802.3 Ethernet frame structure                               |                          |  |            |                       |  |                |                                   |                |
|--|--------------------------|--|------------|-----------------------|--|----------------|-----------------------------------|----------------|
| Preamble   | Start of frame delimiter | MAC destination  | MAC source | 802.1Q tag (optional) | Ethertype (Ethernet II) or length (IEEE 802.3) | Payload        | Frame check sequence (32-bit CRC) | Interframe gap |
| 7 octets   | 1 octet                  | 6 octets   | 6 octets   | (4 octets)            | 2 octets                                       | 46-1500 octets | 4 octets                          | 12 octets      |
|  |                          | ← 64-1518 octets (16-1522 octets for 802.1Q tagged frames) → |            |                       |  |                |                                   |                |
| ← 84-1538 octets (88-1542 octets for 802.1Q tagged frames) → |                          |  |            |                       |  |                |                                   |                |

23

# MAC Address

- Low-level / physical network address:
  - Programmed into hardware devices
  - 6 bytes long, each node globally unique (*usually*)
  - First 3 bytes is registered to an organization (OUI)
  - In AE, MAC address = Ethernet address
- Used to direct data on an Ethernet network:
  - Used in all 802 protocols (such as Wi-Fi)
  - Source / destination
  - Certain bit patterns in the address imply the type of **addressing**.

| 802.3 Ethernet frame structure                               |                          |                 |            |                       |  |                |                                   |                |
|--|--------------------------|-----------------|------------|-----------------------|--|----------------|-----------------------------------|----------------|
| Preamble   | Start of frame delimiter | MAC destination | MAC source | 802.1Q tag (optional) | Ethertype (Ethernet II) or length (IEEE 802.3) | Payload        | Frame check sequence (32-bit CRC) | Interframe gap |
| 7 octets   | 1 octet                  | 6 octets        | 6 octets   | (4 octets)            | 2 octets                                       | 46-1500 octets | 4 octets                          | 12 octets      |
| ← 64-1518 octets (16-1522 octets for 802.1Q tagged frames) → |                          |                 |            |                       |  |                |                                   |                |
| ← 84-1538 octets (88-1542 octets for 802.1Q tagged frames) → |                          |                 |            |                       |  |                |                                   |                |

# Unicast Addresses

- “Point-to-point”
- Used to send data to a specific node
- Universally Administered Address (UAA)
  - 2<sup>nd</sup> LSb of first octet of MAC address is “0”
  - Assigned by manufacturer using OUI
  - Most commonly 00:XX:XX:XX:XX:XX
  - Globally unique
- Locally Administered Address (LAA)
  - 2<sup>nd</sup> LSb of first octet of MAC address is “1”
  - Designates the address is probably not unique outside an **engineered network**. *(Like say..., parts of an automotive network)*
  - E.g 02:XX:XX:XX:XX:XX

# Multicast Addresses

- “One-to-many”
- Specific MAC address that certain NICs are programmed to accept
- Used for protocol, process or vendor specific messaging
- LSb of the first octet of the Address = “1”
- Most commonly **01**:XX:XX:XX:XX:XX
- Broadcast
  - Special case where all NICs are intended to receive
  - MAC address is all 1’s (FF:FF:FF:FF:FF:FF hex)

# Length/Ethertype/VLAN

- Originally, the 16-bit Value following the SA indicated the length of the frame in bytes.
- As Ethernet evolved, this 16-bit value was repurposed\*.
  - Needed a way to specify different information in the same space
  - Values < 1536 indicate length (legacy support)
  - Ethertype:
    - 2 Bytes indicating how information is organized in the Layer 2 header.
    - A value of 0x8100 or 0x9100 indicates the presence of a VLAN information followed by an Ethertype
    - Any other value is just an Ethertype

| 802.3 Ethernet frame structure                               |                          |                 |            |                       |  |                |                                   |                |
|--|--------------------------|-----------------|------------|-----------------------|--|----------------|-----------------------------------|----------------|
| Preamble   | Start of frame delimiter | MAC destination | MAC source | 802.1Q tag (optional) | Ethertype (Ethernet II) or length (IEEE 802.3) | Payload        | Frame check sequence (32-bit CRC) | Interframe gap |
| 7 octets   | 1 octet                  | 6 octets        | 6 octets   | (4 octets)            | 2 octets                                       | 46-1500 octets | 4 octets                          | 12 octets      |
| ← 64-1518 octets (16-1522 octets for 802.1Q tagged frames) → |                          |                 |            |                       |  |                |                                   |                |
| ← 84-1538 octets (88-1542 octets for 802.1Q tagged frames) → |                          |                 |            |                       |  |                |                                   |                |

\*An example of Ethernet evolving to solve future problems as needs arise; key factor in automotive adoption.

27

**INTREPID**  
CONTROL SYSTEMS  
www.intrepidcs.com

# Virtual LANs (VLANs)

- QoS at Layer 2 in hardware
- Ports assigned to “Virtual LANs”
  - Switch enforces forwarding restrictions based on VLAN configuration
  - VLAN traffic is blocked on ports not “a member” of that VLAN
- Used to optimize bandwidth use with least resources

*How is this done? More on this when we talk about switches in detail.....*

28

# Common Automotive Ethertypes

|             |        |                                      |
|-------------|--------|--------------------------------------|
| General Use | 0x0800 | IPv4                                 |
|             | 0x86DD | IPv6                                 |
|             | 0x0806 | Address Resolution Protocol          |
|             | 0x8100 | VLAN - Single Tag                    |
|             | 0x9100 | VLAN - Double Tag                    |
|             | 0x88F5 | Multiple VLAN Reservation Protocol   |
| AVB         | 0x22F0 | IEEE 1722                            |
|             | 0x88F7 | generalized Precision Time Protocol  |
|             | 0x22EA | Multiple Stream Reservation Protocol |
| V2X         | 0x88DC | Wave Short Message Protocol          |

# Payload

- Where the actual Ethernet data is
- Ethertype defines the organization of the payload
- For example in IPv4, the beginning of the IP header starts here.

| 802.3 Ethernet frame structure                               |                          |                 |            |                       |  |                |                                   |                |
|--|--------------------------|-----------------|------------|-----------------------|--|----------------|-----------------------------------|----------------|
| Preamble   | Start of frame delimiter | MAC destination | MAC source | 802.1Q tag (optional) | Ethertype (Ethernet II) or length (IEEE 802.3) | Payload        | Frame check sequence (32-bit CRC) | Interframe gap |
| 7 octets   | 1 octet                  | 6 octets        | 6 octets   | (4 octets)            | 2 octets                                       | 46-1500 octets | 4 octets                          | 12 octets      |
| ← 64-1518 octets (16-1522 octets for 802.1Q tagged frames) → |                          |                 |            |                       |  |                |                                   |                |
| ← 84-1538 octets (88-1542 octets for 802.1Q tagged frames) → |                          |                 |            |                       |  |                |                                   |                |

# Frame Check Sequence (CRC)

- Cyclical redundancy check for data integrity
- If the CRC fails, the frame is usually discarded by the switch or Ethernet MAC
- No built-in error recovery like CAN  
*(this is implemented at higher layers; hint: TCP)*

| 802.3 Ethernet frame structure                               |                          |                 |            |                       |  |                |                                   |                |
|--|--------------------------|-----------------|------------|-----------------------|--|----------------|-----------------------------------|----------------|
| Preamble   | Start of frame delimiter | MAC destination | MAC source | 802.1Q tag (optional) | Ethertype (Ethernet II) or length (IEEE 802.3) | Payload        | Frame check sequence (32-bit CRC) | Interframe gap |
| 7 octets   | 1 octet                  | 6 octets        | 6 octets   | (4 octets)            | 2 octets                                       | 46-1500 octets | 4 octets                          | 12 octets      |
| ← 64-1518 octets (16-1522 octets for 802.1Q tagged frames) → |                          |                 |            |                       |  |                |                                   |                |
| ← 84-1538 octets (88-1542 octets for 802.1Q tagged frames) → |                          |                 |            |                       |  |                |                                   |                |

# Ethernet Switches

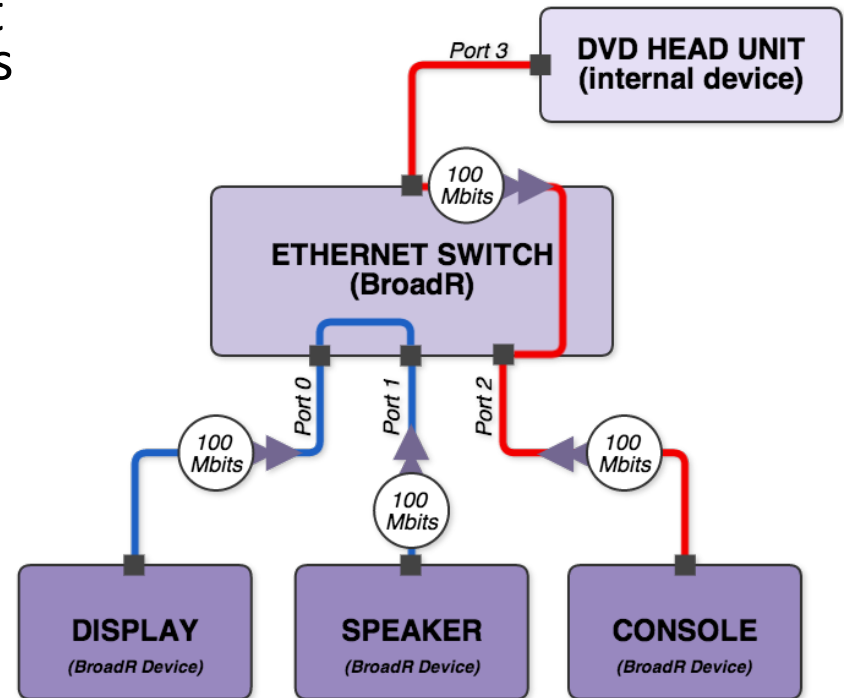

## “The Why and the How”

# Why Use A Switch?

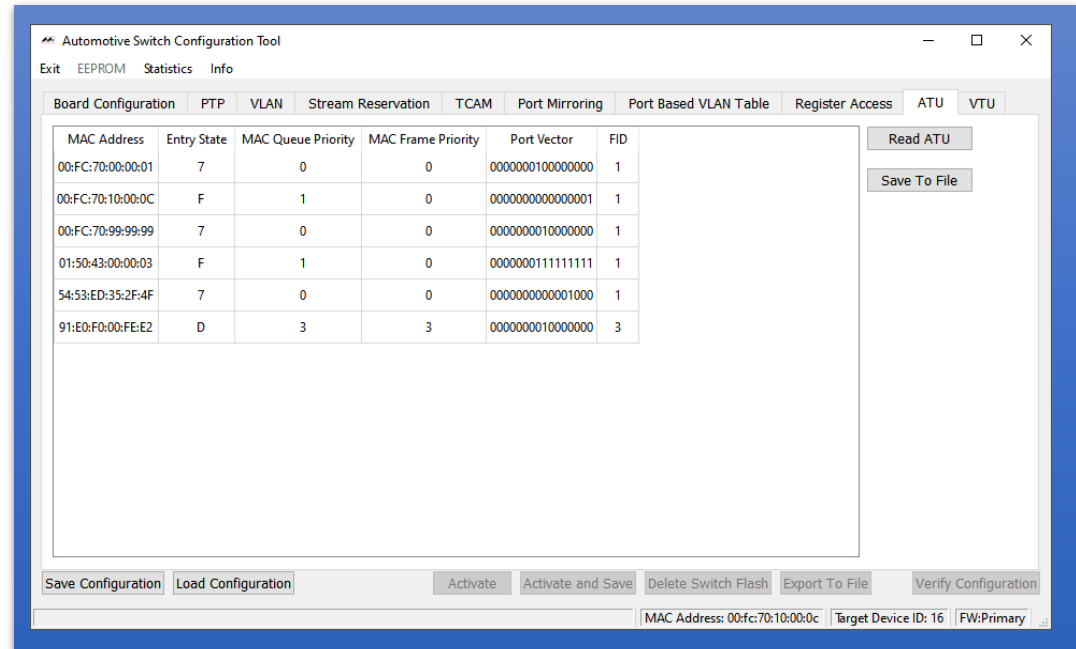

- Conserve bandwidth by intelligent forwarding based on MAC Address
  - Each physical port connection independent
  - No collisions
- Enables L2 QoS
  - Drops bad frames
  - VLAN Enforcement/Management
  - Traffic Prioritization
  - Ingress Limiting
  - AVB/TSN Protocols
- Switches have evolved to deliver additional features and functionality

400 Mbits of bandwidth!

# Intelligent Frame Forwarding

- L2 Address Table
  - Used by *Address Translation Unit*
  - Table of Address/Port (physical) associations
- Information Stored
  - MAC Address
  - Destination Port Vector (DPV) (bit array of ports for the MAC)
  - VLAN Information (FID / Filtering Information Database)
  - Static or Learned
  - Priorities

The screenshot shows the 'Automotive Switch Configuration Tool' interface. The 'ATU' tab is selected, displaying a table of MAC addresses and their associated port vectors. The table has columns for MAC Address, Entry State, MAC Queue Priority, MAC Frame Priority, Port Vector, and FID. The data is as follows:

| MAC Address       | Entry State | MAC Queue Priority | MAC Frame Priority | Port Vector      | FID |
|-------------------|-------------|--------------------|--------------------|------------------|-----|
| 00:FC:70:00:00:01 | 7           | 0                  | 0                  | 0000000100000000 | 1   |
| 00:FC:70:10:00:0C | F           | 1                  | 0                  | 0000000000000001 | 1   |
| 00:FC:70:99:99:99 | 7           | 0                  | 0                  | 0000000010000000 | 1   |
| 01:50:43:00:00:03 | F           | 1                  | 0                  | 0000000111111111 | 1   |

Below the table, there are buttons for 'Read ATU' and 'Save To File'. At the bottom of the window, there are buttons for 'Save Configuration', 'Load Configuration', 'Activate', 'Activate and Save', 'Delete Switch Flash', 'Export To File', and 'Verify Configuration'. The status bar at the bottom shows 'MAC Address: 00:fc:70:10:00:0c', 'Target Device ID: 16', and 'FW:Primary'.

# Unmanaged and Smart Switches

- No official delineation
- Unmanaged Switch
  - Little or no configuration
  - MAC Based Routing
  - Learns L2 Address Table
  - Floods unknown DAs
  - Possibly static L2 Address table configuration
- Smart Switch
  - Basic VLAN Support (Static Config, Enforcing Tag/Priority, tag/un-tag, etc.)
  - Port Mirroring

# Managed Switches

Managed Switch enhances QoS and Security

- Addition of host processors or embedded cores
- Firmware executes protocols
  - Dynamic VLAN management (MVRP)
  - Manage Redundant Paths (Spanning Tree Protocol, etc.)
  - AVB/TSN Protocols
- Other advanced features
  - Deep Packet Inspection
  - Ingress Policing and Limiting

# Smart Switch Example: RAD-Pluto

## 5-Ports - Based on NXP SJA1105

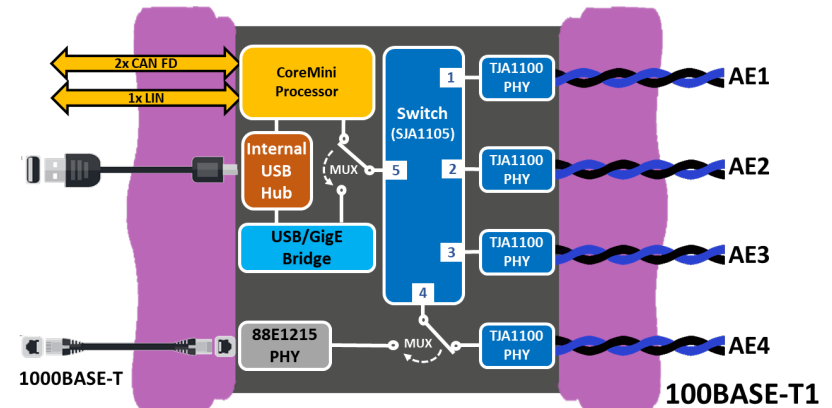

- 3x 100BASE-T1
- 1x 100BASE-T1 or 1x 1000BASE-T
- 1x USB3/GIGE Bridge

## Integral CAN/LIN Interfaces

- 2x CAN-FD
- 1x LIN
- Embedded Function Block Execution

## Use Cases

- VLAN Tagging/Untagging (Static)
- Port Forwarding
- Gateway applications
- Media Conversion
- Frame Mirroring and VLAN tagging for advanced debug and monitoring.

# Managed Switch Example: RAD-Jupiter

Based on Marvell 88Q5050

## 7-Port Managed Switch

- 5x 100BASE-T1
- 1x 1000BASE-T1 or 1000BASE-T
- USB3/GIGE Bridge or 1x 1000BASE-T
- **AVB/TSN Protocol Support**
- **Packet Inspection (TCAM)**
- **Per-port address whitelisting/blacklisting**

## Advanced Features

- **AVB/TSN Protocols**
- **TCAM**
- **Ingress Rate Limiting**
- **“Cut-Through” Forwarding**

## Integral CAN/LIN Interfaces

- 2x CAN-FD
- 1x LIN
- Embedded Function Block Execution

## Use Cases

- **AVB/TSN Development & Testing**
- Gateway applications
- Media Conversion
- Frame Mirroring and VLAN tagging for advanced debug and monitoring.

# Network Layer

# Why do we need higher layer protocols?

## *Inherent problems with Ethernet....*

- MAC Addresses tied to hardware (physical address)
  - Much like CAN frames
  - Physical Addressing
    - What if you move a server to new hardware with a new MAC Address?
  - Connectionless
    - What if the receiver is not ready or has a limited buffer size?
    - What if the same physical address is running multiple logical programs?
- An Ethernet frame is 1500 bytes.
- Ethernet is lossy
  - No guarantee frames arrive in order
  - No guarantee frames arrive at all.....

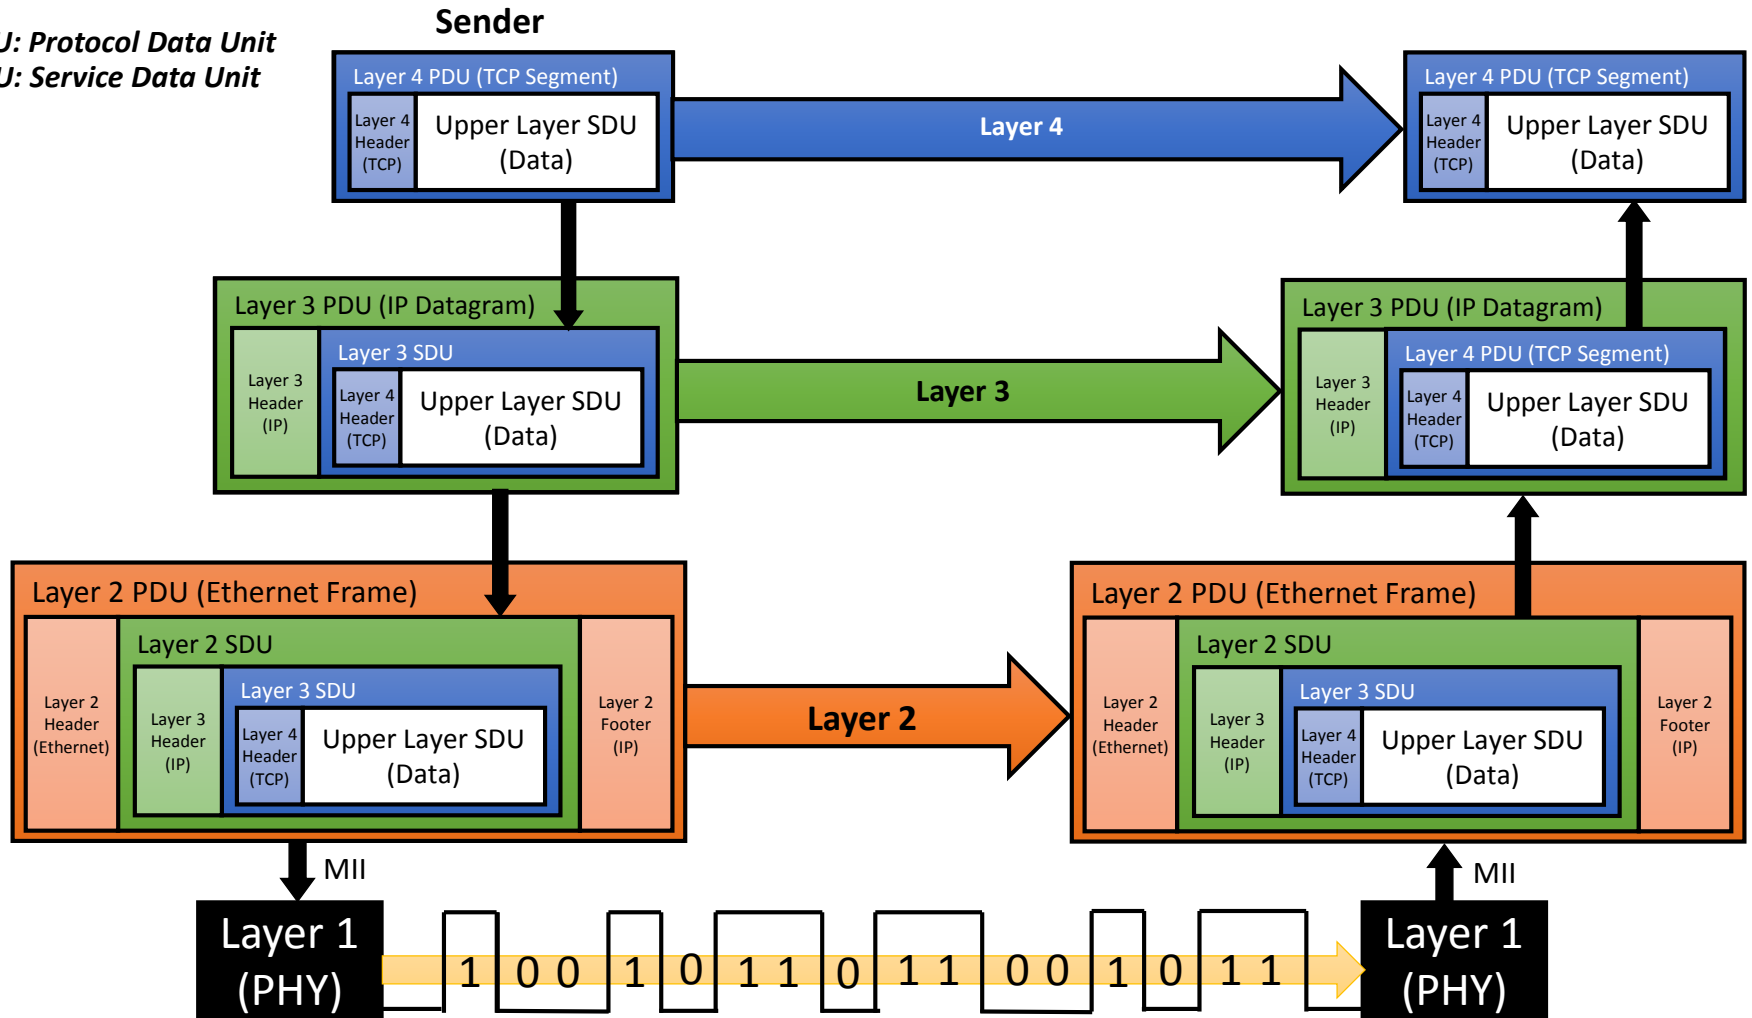

# Message Encapsulation

**PDU: Protocol Data Unit**

**SDU: Service Data Unit**

# IP Header

(Slide 1/4)

IPv4 has the  
EtherType 0x0800

4 for IPv4

Destination IP address

Extra options; in practice almost always empty

# Transport Layer

# The Departure from Signal-Based Messaging

- CAN was always meant to be a sensor network
  - “Implicit availability” – periodic messages with latest values
  - Works well for simpler systems to just get signal values from point A to point B
- Consequently CAN is not well suited for
  - Two nodes need to ***negotiate parameters***
  - ***Stateful connections*** between many functional units (think of the communication between a hands-free phone and the head unit)
- Ethernet Protocols introduce the concept of a logical connection
  - Exclusive between 2 software processes
  - Negotiation on connection, flow control, and disconnection
  - In some cases reliability (at the expense of high availability)

47

# Process-Level Addressing: Ports

- IP address identifies a device (ECU or NIC on a PC)
- TCP and UDP use *Ports* to identify software processes
  - Application or Function
  - Virtual ECU within the module
- IP address + port = **socket**
  - Sockets uniquely identify an Internet connection between specific processes on two different IP Addresses
- TCP and UDP messages include 16-bit source and destination port addresses (0 to 65,535)
- Well-known ports solve the problem of how to know where to send particular types of requests on a device (e.g., 80 for Web servers)

48

**INTREPID**  
CONTROL SYSTEMS  
[www.intrepidcs.com](http://www.intrepidcs.com)

# A word about “ports”

- Logical Ports
  - Layer 4 concept to differentiate logical connections
  - Port + IP Address = Socket
- Physical Ports
  - Connection between Physical Layer (PHY) and the Physical Media
  - “Port” on a switch
  - “Port” on a computer

It’s all about the context...

For example, are these referring to a physical or logical port

*The switch needs to be configured to forward between the desired ports for your application. Switch = Layer 2, must be physical*

*The router is setup for port forwarding. Router = Layer 3, must be logical*

*The server is connected to the wrong port. Need more info....*

# UDP (User Datagram Protocol)

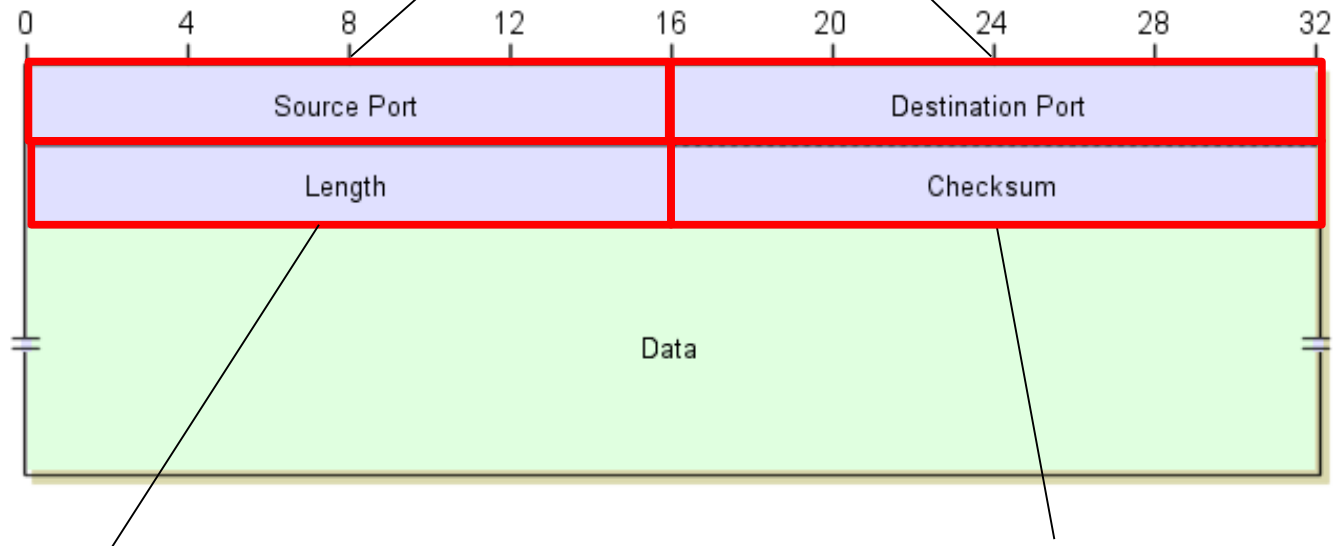

# User Datagram Protocol (UDP)

- Lighter transfer protocol than TCP
  - Unreliable by design
    - Does not guarantee delivery and packet order
    - Used where timely delivery is more important than service guarantees
- Analogous to a CAN frame
  - No acknowledgement from recipient (“Fire and Forget”)
  - Usually no specific recipient (multi or broadcast)
  - Easy to “map” CAN messaging over to Ethernet with UDP
  - Unlike CAN, UDP has no U-Code
    - Flag set when expected information is not received
    - UDP intended to be lightweight. Need something more? Use another protocol (like TCP).

# UDP Header

Source and Destination Ports –  
Assigned to specific processes

Length of UDP (up to 64K bytes)

Optional checksum, 0 = no checksum,  
All 1's = 0 checksum

# TCP (Transmission Control Protocol)

# Transmission Control Protocol (TCP)

- TCP is a full-featured transfer protocol
  - TCP turns Ethernet into a ***reliable, connection-oriented*** stream
  - Analog in CAN is ISO 15765-2
- Unlike other protocols, TCP has the native concept of a connection
  - For two nodes to talk, one must initiate a connection to another, and it must be accepted
  - Creates an implicit ***client/server*** model
  - Web browsers talk to websites over TCP

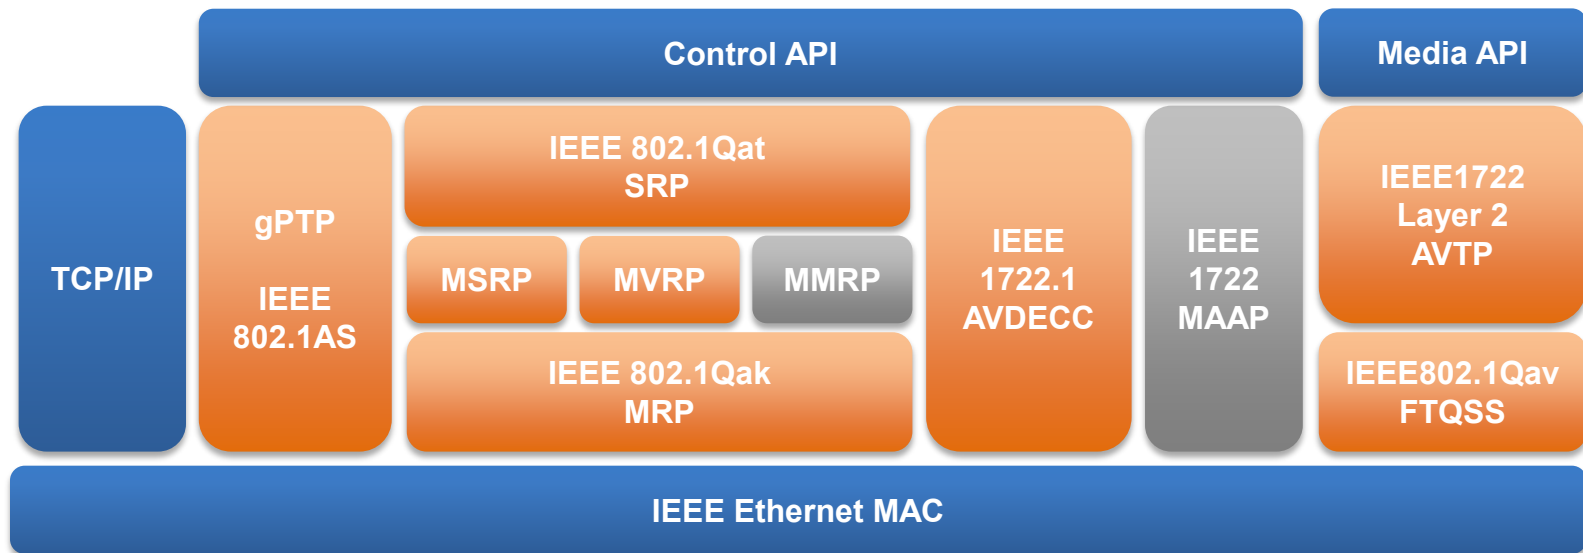

# Transmission Control Protocol (TCP)

- TCP guarantees that all packets will
  - Arrive at the client
  - Be seen by the receiving application in the same order they were sent
- The second point is one often overlooked by other protocols
- Since Ethernet is switched, each packet could take different paths and arrive out-of-order
